The toxicity of the battery material is a direct threat to organisms on various trophic levels as well as direct threats to human health.

What happens if a lithium ion battery goes bad?

Lithium-ion batteries are electro-chemical energy storage devices with a relatively high energy density. Under a variety of scenarios that cause a short circuit, batteries can undergo thermal-runaway where the stored chemical energy is converted to thermal energy. The typical consequence is cell rupture and the release of flammable and toxic gases.

Are lithium ion batteries flammable?

The electrolyte in a lithium-ion battery is flammableand generally contains lithium hexafluorophosphate (LiPF 6) or other Li-salts containing fluorine. In the event of overheating the electrolyte will evaporate and eventually be vented out from the battery cells. The gases may or may not be ignited immediately.

Are lithium-ion batteries a fire hazard?

Lithium-ion batteries (LIBs) present fire, explosion and toxicity hazards through the release of flammable and noxious gases during rare thermal runaway (TR) events. This off-gas is the subject of active research within academia, however, there has been no comprehensive review on the topic.
