The increase of vehicles on roads has caused two major problems, namely, traffic jams and carbon dioxide (CO<sub>2</sub>) emissions. Generally, a conventional vehicle dissipates heat during consumption of approximately 85% of total fuel energy [2], [3] in terms of CO<sub>2</sub>, carbon monoxide, nitrogen oxide, hydrocarbon, water, and other greenhouse gases (GHGs); 83.7% of ...

energy is stored in another storage medium [4]. Steam accumulation is the simplest heat storage technology for DSG since steam is directly stored in a storage pressure vessel, i.e., steam accumulator, in form of pressurized saturated water [5]. Discharging from steam accumulators usually takes place from the top part of the

Increased demand for automobiles is causing significant issues, such as GHG emissions, air pollution, oil depletion and threats to the world's energy security [[1], [2], [3]], which highlights the importance of searching for alternative energy resources for transportation.
