Watt-hours measure how much energy (watts) a battery will deliver in an hour, and it's the standard of measurement for a battery. When dealing with large amounts of energy, like with batteries, capacity is typically measured in kilowatt hours (kWh) which is 1,000 watt-hours, or gigawatt-hours (GWh) which is one billion watt-hours.

Power capacity or rating is measured in megawatts (MW) for larger grid-scale projects and kilowatts (kw) for customer-owned installations. Energy storage capacity: The amount of energy that can be discharged by the battery before it must be recharged. It can be compared to the output of a power plant.

For example, if our total daily average energy demand is 15,000 Wh, we work backward to find that we need a battery capacity of 10,000 Wh ($10,000 \times 1.5 = 15,000$). To find our hours of autonomy, we multiply our newly found battery capacity (10,000 Wh) by 24 hours, then divide that by the daily average energy demand (15,000 Wh).
