What is energy storage performance testing?

Performance testing is a critical component of safe and reliable deployment of energy storage systems on the electric power grid. Specific performance tests can be applied to individual battery cells or to integrated energy storage systems.

Which components of a battery energy storage system should be factory tested?

Ideally, the power electronic equipment, i.e., inverter, battery management system (BMS), site management system (SMS) and energy storage component (e.g., battery) will be factory tested together by the vendors. Figure 2. Elements of a battery energy storage system

What is battery capacity testing?

Capacity testing is performed to understand how much charge /energy a battery can store and how efficient it is. In energy storage applications, it is often just as important how much energy a battery can absorb, hence we measure both charge and discharge capacities.

What is a battery energy storage system?

Battery energy storage systems (BESSs) are being installed in power systems around the world to improve efficiency, reliability, and resilience. This is driven in part by: engineers finding better ways to utilize battery storage, the falling cost of batteries, and improvements in BESS performance.
