PCMs (phase change materials) applied in heat storage technology are on the one hand characterised by relatively large specific heat capacity, and on the other hand by relatively low thermal conductivity (e.g. 0.2 W·m-1·K-1) for paraffin), which prolongs the charging/discharging cycles of heat accumulators based on such materials. In order to ...

Experimental study on latent thermal energy storage system with gradient porosity copper foam for mid-temperature solar energy application. Appl. Energy, 261 (2020), p. 114472.

7.6.2 Pin Gating. An alternate technique of gating rotors is to use a series of pin gates, which feed the liquid copper directly into the end ring. Although the ICA/CDA team has less experience with gating copper rotors in this manner, the pin gating technique is widely used for the die-casting of aluminum rotors.

There are three typical categories of TES: sensible heat [6], latent heat [7] and thermo-chemical reaction [8] pared with sensible heat and thermo-chemical thermal heat energy storage, latent heat thermal energy storage (LHTES) has the following merits: (1) high thermal storage density, (2) temperature variation is small during the phase change process.

Among them, thermal energy storage facilities are generally used to store discontinuous renewable energy such as solar energy and wind energy, as well as low-cost electricity at night. Configuration systems studied are often rectangular, cylindrical, and shell-tube. ... To enhance the heat transfer rate of the ice storage sphere, the pins and ...

The application of stearic acid in the latent thermal energy storage (LTES) systems is hindered due to its lower heat transfer rate.
