Flywheel energy storage systems [OCCF] has been developed for spacecraft applications. The OCCF has been tested to 20,000 RPM where it has a total stored energy of 15.9 WH and an angular momentum of 54.8 N-m-s (40.4 Ib-ft-s). Motor current limitations, caused by power losses in the OCCF system, prevented testing to a higher speed.

In the field of flywheel energy storage systems, only two bearing concepts have been established to date: 1. Rolling bearings, spindle bearings of the & #x201C;High Precision Series& #x201D; are usually used here.. 2. Active magnetic bearings, usually so-called HTS (high-temperature superconducting) magnetic bearings.. A typical structure consisting of rolling ...

Broadly speaking, the flywheel spinning speed ω allows classifying FESSs in two types [7]: low-speed FESSs (< 6000 rpm) and high-speed FESSs ($10^4 - 10^5$ rpm). In order to maximize the energy efficiency low-speed FESSs make use of conventional technologies, whereas high-speed FESSs make use of advanced technologies.
