How to develop a fuel cell system suitable for HD fuel cell applications?

The project approach is to develop a novel fuel cell system suitable for HD fuel cell applications through a bottom-up design and/or selection of key components (bipolar plates, MEAs) from single cell to stack to system.

What is a fuel cell?

A fuel cell is an electrochemical device that converts the chemical energy of a fuel directly into electrical energy.

What are the design considerations of a fuel cell?

The design considerations include isolation levels, input/output current and voltage characteristics, parallel/series fuel cell stacks, current leakage pathways, operating efficiency, thermal management, and single/ bi-directional power flow.

What should be included in a fuel cell system design?

The models should also include the impact of platinum group metal (PGM) recycling, even at a minimum of recuperating 20% of the Pt value, and then showing the impact of recovering higher values. The priority on rail or marine system cost analysis does not match. The fuel cell system design should be created and agreed upon first.

What is a complete fuel cell system?

A complete fuel cell system consists of the fuel cell stack in addition to the BoP subsystems. BoP subsystems are complementary components that provide the oxidant and fuel supply and storage, thermal management, water management, power conditioning, and instrumentation and control of the fuel cell system.

Why do we need a standard for hydrogen and fuel cell systems?

Because hydrogen and fuel cell systems are complex and will be used in a wide range of applications, many standards development organizations are working to develop codes and standards needed to prepare for the commercialization of alternative fuel vehicle technologies.

fuel cell, any of a class of devices that convert the chemical energy of a fuel directly into electricity by electrochemical reactions. A fuel cell resembles a battery in many respects, but it can supply electrical energy over a much longer period of time. This is because a fuel cell is continuously supplied with fuel and air (or oxygen) from an external source, ...

Fuel cell systems are used for applications such as stationary power units and for transportation, that is, electric vehicles. A fuel cell system has three basic parts: the fuel cell stack; the fuel processing unit; and a heat recovery system that processes the excess heat that is a by-product of the fuel cell operation.
