

# How long does it take to cure urinary retention

How is acute urinary retention treated?

You'll need treatment right away for acute urinary retention. A catheter will likely be inserted to help quickly drain the urine. Local anesthesia will be used to make sure you don't feel pain or discomfort from the catheter.

How does acute urinary retention work?

With acute urinary retention, a health care professional will immediately drain the urine from your bladder using a catheter. Removing the urine from the bladder eases your pain and helps prevent your bladder and kidneys from being damaged.

Do you need medical treatment for temporary urinary retention?

People who experience temporary urinary retention due to medication or anesthesia may not need medical treatment if the symptoms disappear and do not return. Although anyone can develop urinary retention, it is more common as a person ages.

What if I have chronic urinary retention?

If you have chronic urinary retention, your health care professional will first try to diagnose and treat the cause of your retention. However, your health care professional may need to use a catheter to drain the urine from your bladder if the retention continues or becomes severe.

How do health care professionals treat urinary retention?

Health care professionals treat urinary retention based on the type of urinary retention--acute or chronic--and the cause of the urinary retention. With acute urinary retention, a health care professional will immediately drain the urine from your bladder using a catheter.

What is the difference between acute and chronic urinary retention?

Chronic urinary retention means that your symptoms are more gradual. Blockages, medications and nerve problems are common reasons a person may have urinary retention. The acute form of urinary retention is an emergency. In this case, you'll need to see a healthcare provider right away.
