The large-scale development of energy storage began around 2000. From 2000 to 2010, energy storage technology was developed in the laboratory. Electrochemical energy storage is the focus of research in this period. From 2011 to 2015, energy storage technology gradually matured and entered the demonstration application stage.

Large-scale solar is a non-reversible trend in the energy mix of Malaysia. Due to the mismatch between the peak of solar energy generation and the peak demand, energy storage projects are essential and crucial to optimize the use of this renewable resource. Although the technical and environmental benefits of such transition have been examined, the profitability of ...

Pumped hydro storage (PHS) is a type of hydroelectric storage system which consists of two reservoirs at different elevations. It not only generates electricity from the water movement through the turbine, but also pumps the water from the lower elevation to upper reservoir in order to recharge energy [164].
