Such a sodium-ion energy performance can be projected to be at an intermediate level between commercial LIBs based on  $\text{LiFePO}_4$  and those based on  $\text{LiCoO}_2$  cathode materials. Faradion's SIBs can be an excellent alternative to LABs as low-cost batteries for electric transport, such as e-scooters, e-rickshaws, and e-bikes.

Sodium batteries are not as energy dense as Lithium batteries. Solid state batteries are starting to come out. So Sodium batteries will be great for the 12 v starter vehicle battery (I have had one for 2 months) and they will be good for home Battery Storage. They promise to be half the cost of Lithium and are good at resisting fires for homes.

Battery deployment must increase sevenfold by 2030 to achieve COP28 targets. To this end, based on net-zero emissions (NZE), battery demand will increase from 0.86 terawatt-hour (TWh) in 2023 to a total of 6 TWh in 2030, categorized in electric vehicles (EVs) (5.40 TWh), grid storage (0.52 TWh), and behind-the-meter (0.1 TWh) sectors (Figure 1a).). Battery ...
