SC's technology has evolved in last few decades and has shown immense potential for their application as potential energy storage system at commercial scale. Compared with conventional rechargeable batteries supercapacitors have short charge/discharge times, exceptionally long cycle life, light weight and are environmentally friendly.

Therefore, the basic challenge for supercapacitors is low energy density. So, the restriction issue for storage charge to the surface (or near surface) of supercapacitors results the energy density (or capacity) to be much lower than that of batteries []. Hence, great works have been done to raise their energy density (E).

MIT engineers have created a "supercapacitor" made of ancient, abundant materials, that can store large amounts of energy. Made of just cement, water, and carbon black (which resembles powdered charcoal), the device could form the basis for inexpensive systems that store intermittently renewable energy, such as solar or wind energy.

As a novel kind of energy storage, the supercapacitor offers the following advantages: 1. Durable cycle life. Supercapacitor energy storage is a highly reversible technology. 2. Supercapacitor energy storage has problems

Supercapacitors, also known as ultra-capacitors, are polar capacitors with a large capacitance but a low voltage rating. Supercapacitors have low voltage ratings of about 2.5-2.7 V, and their capacitance may range from 100 to 12,000 F. Supercapacitor is an energy storage device that bridges a capacitor and a battery.

The electrochemical energy storage/conversion devices mainly include three categories: batteries, fuel cells and supercapacitors.
