and wind, and 24/7 reliability. Utilities are intrigued by the potential for storage to meet other needs such as relieving congestion and smoothing out the variations in power that occur independent of renewable-energy generation.

The transition to renewable energy sources such as wind and solar, which are intermittent by nature, necessitates reliable energy storage to ensure a consistent and stable supply of clean power. The evolution of LDES Long-duration energy storage is not a new concept. Pumped hydro-electric storage was first installed in Switzerland in 1907.

Section 2 delivers insights into the mechanism of TES and classifications based on temperature, period and storage media. TES materials, typically PCMs, lack thermal conductivity, which slows down the energy storage and retrieval rate. There are other issues with PCMs for instance, inorganic PCMs (hydrated salts) depict supercooling, corrosion, thermal ...

TES systems are divided into two categories: low temperature energy storage (LTES) system and high temperature energy storage (HTES) system, based on the operating temperature of the energy storage material in relation to the ambient temperature [17, 23].
