Grid-Connected Inverters. Grid integration: Sends energy directly to the main grid, synchronizing with grid frequency and phase. No energy storage: A grid-connected inverter does not require batteries, as it delivers power directly to the grid. Limited control: Cannot regulate energy delivery; power generated is immediately sent to the grid.

Instead, an energy storage inverter is used to convert electrical energy from the grid or other AC power source into DC power to charge energy storage devices. The selection and integration of these two devices depend on the specific application requirements and system design.
